INSURANCE COMPARISON PLATFORM — PRODUCT BIBLE

SECTION 2.5 — CORPORATE ACCOUNT MODEL

Account Structure, Token System, Billing Integration, Deposit Doctrine & Dashboard Differentiation

Version 1.0 | March 2026 | Section 2 — Identity, Accounts & Membership Infrastructure

2.5.0 — Purpose & Scope

This section defines the Corporate Account as a distinct platform identity — separate from Solo and Group accounts not by headcount but by financial structure, operational purpose, and contractual relationship. It governs account creation, the token gate, billing integrations, deposit rationale, credit governance, and dashboard differentiation.

This section binds to: Section 10.2 (MVP Pricing & Entitlement Governance), Section 8.4 (Permissioning & Audit Logs), Section 3.5 (Trip Maturity States), Section 8.7 (Export & Data Egress Governance).

2.5.1 — What Makes an Account Corporate

Corporate status is not defined by group size. It is defined by two criteria, either of which qualifies an account for Corporate designation:

- Financial centralization: One entity (a business, institution, organization, or individual acting in a business capacity) assumes financial responsibility for all travelers on the account.
- Operational structure: The account requires centralized billing controls, admin-level visibility across travelers, organizational reporting, or vendor access that exceeds what the Group tier provides.

A solo founder managing their own business travel qualifies. A church group of 40 people where each person pays individually does not. Size is irrelevant. Structure is determinative.

INVARIANT CORP-1: No account may self-assign Corporate status. Corporate accounts are created exclusively through the registration token process. Any account that attempts to access Corporate features without a valid token is rejected at the authentication layer.

2.5.2 — Registration Token System

Corporate account creation is token-gated. The token is not a paywall — it is a relationship gate. It triggers a different onboarding path, different terms of service, different billing structure, and different dashboard provisioning.

2.5.2.1 — Token Request Flow

Step	Actor	Action

1	Prospective corporate account holder	Selects "Corporate Account" on platform. Submits: organization name, estimated traveler count, billing contact, intended use (working travel, incentive trip, conference, etc.)
2	Platform (auto)	Validates submission completeness. Generates registration token. Sends token to billing contact email with Corporate Terms of Service link.
3	Account holder	Reviews and accepts Corporate ToS. Activates token. Proceeds to corporate onboarding.
4	Platform (auto)	Provisions corporate namespace: admin dashboard, billing account, traveler roster infrastructure, audit log scope.
5	Account holder	Completes billing integration setup (see 2.5.4). Pays activation deposit (see 2.5.5). Account goes live.

2.5.2.2 — Token Anti-Gaming Rules

- Tokens are single-use and account-specific. A token cannot be transferred or reused.
- Token issuance does not guarantee approval — the platform reserves the right to decline Corporate accounts that do not meet billing or terms requirements.
- Accounts attempting to access Corporate features via token sharing or forgery are permanently banned and flagged to the event ledger.

2.5.3 — Group vs. Corporate: Defining Differences

Dimension	Group	Corporate
Financial structure	Distributed — individuals pay their own way, at least partially	Centralized — one entity pays for all travelers
Contractual relationship	None beyond standard ToS	Formal agreement, deposit, rollover terms, Corporate ToS
Account creation	Self-service, no gate	Token-gated, assisted onboarding
Dashboard	Shared itinerary context, individual credit views	Admin dashboard: per-traveler credit status, billing controls, aggregate reporting
Billing	Individual payment per person	Centralized billing account with HR/expense system integration
Vendor access	Standard catalog	Expanded — vendors with minimum volume requirements unlocked
Deep Scan credits	Individual — purchased personally	Individual per traveler — purchased/authorized by admin
Credit authorization	Self-authorized	Admin approves additional credit purchases per traveler via dashboard
Support	Standard queue	Priority queue, named account contact
Cancellation	No commitment	Deposit held on cancellation, credits roll over 12 months
Traveler data visibility	Personal only	Admin sees credit status and itinerary attachment status — never individual evidence or claim content

Deposit required	No	Yes — see 2.5.5

2.5.4 — Billing Integrations

Corporate accounts must not be required to enter payment details manually if they already operate within a supported expense management ecosystem. The platform supports the following integrations in priority order:

System	Integration Type	Priority	Notes
SAP Concur	API / pre-built connector	1 — Primary	Market leader. Supports automated expense report creation, itinerary sync, and invoice processing. Open API available for custom integration where pre-built connector is insufficient.
Workday	API / HR data sync	2	Dominant in HR-first organizations. Native integration with HR, payroll, and finance. Employee roster sync eliminates manual traveler entry.
Navan (TripActions)	API	3	Modern corporate travel platform. Itinerary ingestion enables automatic Deep Scan triggers on booking confirmation.
AmEx GBT	API / data feed	4	American Express Global Business Travel. Strong enterprise penetration. Supports itinerary and billing data sync.
Manual / Invoice	Fallback only	Last resort	Net-30 invoice available for accounts that cannot integrate. Requires pre-approval. No check payments accepted.

PRINCIPLE: No corporate account holder should have to struggle to connect payment details. If a supported integration is unavailable for their system, the platform flags it and offers the manual fallback. The goal is zero friction between "account activated" and "billing confirmed."

2.5.5 — Activation Deposit Doctrine

2.5.5.1 — Why a Deposit Exists

A corporate account activation commits real platform resources before a single traveler does anything. These resources cannot be recovered if the account cancels. The deposit is cost recovery for committed infrastructure — not a security deposit against bad behavior, and not a percentage of trip value.

Resources committed at corporate account activation:

- Onboarding compute: token generation, account namespace initialization, admin dashboard provisioning, billing integration setup.
- Infrastructure allocation: dedicated database namespace, expanded audit log scope, admin visibility tooling.
- Security surface expansion: a corporate account with multiple travelers is a larger attack surface. Additional monitoring and session management is provisioned at activation.
- Vendor coordination: if the account size or destination triggers outreach to local partners or expanded vendor access, that is relationship work performed at activation.
- Support commitment: priority queue access and named account contact are allocated at activation, not at first use.

2.5.5.2 — Deposit Structure

Component	Amount	Rationale
Flat activation deposit	$399	Covers onboarding, infrastructure provisioning, and first support cycle regardless of traveler count. Non-refundable.
Per-seat reservation (20+ travelers)	$20/confirmed traveler slot	Covers marginal cost of provisioning each traveler account, credit allocation, and admin visibility tooling. Rolls over as platform credits on cancellation.

2.5.5.3 — Cancellation & Rollover Policy

- Flat activation deposit ($399): Non-refundable. Work was performed at activation. Cannot be credited.
- Per-seat component: Rolls over as platform credits valid for 12 months from cancellation date. Applied automatically to the next corporate engagement from the same organization.
- If the organization dissolves or does not return within 12 months: per-seat credits expire. No cash refund.
- All deposit transactions are logged to the event ledger with timestamp, account ID, and Founder actor_id confirmation.

INVARIANT CORP-2: No corporate account cancellation results in a full refund of the activation deposit under any circumstances. The deposit exists because resources were already committed. This is stated clearly in the Corporate ToS at the point of token activation — not buried in fine print.

2.5.6 — Credit Governance for Corporate Accounts

Deep Scan credits in corporate accounts are individual — assigned per traveler, never pooled. This is a doctrine-level decision, not a technical limitation.

Rationale: travelers have different itinerary complexity, different planning styles, and different risk profiles. Pooling credits penalizes thorough planners and subsidizes careless ones. Every traveler on a corporate account gets their own credit allocation and is responsible for managing it.

2.5.6.1 — Credit Authorization Flow

Scenario	What Happens
Traveler exhausts included credits	Platform surfaces "Request Additional Credits" option in the traveler's view. Request routes to corporate admin dashboard for approval — not to the platform operator.
Admin approves request	Platform charges the corporate billing account on file. Credits are added to that individual traveler's allocation. Transaction logged to event ledger.
Admin declines request	Traveler is notified. No charge. Traveler may purchase additional credits personally at standard à la carte pricing.
Admin wants to pre-allocate additional credits	Admin may purchase credit packs per traveler in advance via the dashboard. 3-pack per traveler at $79.99, 5-pack at $124.99.

INVARIANT CORP-3: The platform operator is never the human in the loop for individual traveler credit authorization. That role belongs to the corporate admin. The platform enables the workflow — it does not manage it.

2.5.7 — Corporate Dashboard: Admin View

The corporate admin dashboard is a distinct product surface from the traveler-facing interface. It shares the same underlying engine but presents a fundamentally different view.

Admin dashboard capabilities:

- Traveler roster: add, remove, and manage traveler accounts. Bulk invite via email list or HR system sync.
- Credit status per traveler: how many credits each traveler has, how many they have used, pending authorization requests.
- Itinerary attachment status: which travelers have attached itineraries to the current trip context. Does not show itinerary content.
- Billing management: view invoices, update payment method, review charge history, download receipts.
- Credit pack purchasing: buy additional credit packs per individual traveler.
- Aggregate trip status: overall trip readiness — how many travelers have completed onboarding, attached policies, run scans.

Admin dashboard explicitly does NOT include:

- Individual traveler evidence, incident timelines, or claim content — ever.
- Policy document content uploaded by individual travelers.
- Deep Scan output for individual travelers.
- Any personally identifiable health, financial, or legal information submitted by travelers.

INVARIANT CORP-4: The corporate admin is an organizational account manager, not a surveillance tool. Admin visibility is limited to operational status and billing. Individual traveler data is private to that traveler regardless of who is paying for their account.

Parent Section: Section 2.5 (Corporate Account Model)
Status: v1.0 — Approved March 2026

2.5.8 — Corporate Admin Acting on Behalf of Employee

Parent Section: Section 2.5 (Corporate Account Model)
Status: v1.0 — Approved March 2026

Purpose

Corporate admins (HR managers, IT staff) can create incidents and upload evidence **on behalf of employees** when employees cannot access their accounts or need assistance documenting incidents.

Use Cases:

- Employee lost all devices (cannot log in to document incident)
- Employee hospitalized (HR manager documents medical emergency)
- Device stolen with proprietary data (IT manager creates security incident)
- Employee unfamiliar with platform (HR assists with incident creation)

Corporate Admin Permissions

What Corporate Admins CAN Do on Behalf of Employees:

✅ **Create incidents** for employee trips
✅ **Upload evidence** (police reports, receipts, medical documents)
✅ **Add notes** to employee incidents
✅ **View employee trip itineraries** (oversight only)
✅ **Document device theft/loss** as security incidents

What Corporate Admins CANNOT Do:

❌ **Export employee claim packets** (requires employee consent + Founder approval)
❌ **Delete employee evidence** (only employee can delete their own evidence)
❌ **Modify employee trip settings** (employee controls their own trips)
❌ **View other employees' private evidence** (privacy-protected)

Attribution Model

All actions taken on behalf of employee MUST be clearly attributed:

Incident Created:

- Subject: John Doe (employee)
- Created by: Jane Smith (HR Manager) on behalf of John Doe
- Timestamp: March 13, 2026 4:45pm EST

Evidence Uploaded:

- Filename: police_report_stolen_phone.pdf
- Uploaded by: Jane Smith (HR Manager) on behalf of John Doe
- Upload timestamp: March 13, 2026 4:50pm EST

Employee sees:

Police Report - Stolen Phone

Uploaded by: Jane Smith (HR) on March 13, 2026

[View PDF]

Clear attribution so employee knows who documented what on their behalf.

Flow: Create Incident on Behalf of Employee

Step 1: Corporate Admin Access

HR manager (Jane) logs into platform:

1. Goes to: **Corporate Dashboard → Employee Roster**
2. Searches for: **John Doe**
3. Clicks: **[View John's Profile]**

Step 2: Create Incident

Jane sees:

```
╔═══════════════════════════════════════════════════════════════════════════════
═══════════════════════════╗
│  John Doe (john.doe@acmecorp.com)                          │
╠═══════════════════════════════════════════════════════════════════════════════
═══════════════════════════╣
│  Current Trip: London Business Trip (March 10-15, 2026)    │
│  Status: Active                                            │
│                                                            │
│  [View Trip Details] [Create Incident on John's Behalf]    │
╚═══════════════════════════════════════════════════════════════════════════════
═══════════════════════════╝
```

Jane clicks: **[Create Incident on John's Behalf]**

Platform prompts:

```
You're creating an incident for John Doe
```

This will be logged as:

"Created by Jane Smith (HR Manager) on behalf of John Doe"

John will be notified and can view/edit this incident.

Incident Type:

◉ Lost/stolen device

○ Medical emergency

○ Flight disruption

○ Baggage issue

○ Other

[Continue] [Cancel]

Step 3: Fill Incident Details

Jane completes incident form:

Incident: Phone stolen in London

Date/Time: March 10, 2026, 2:30pm GMT

Location: Hotel Intercontinental, London

Description:

Employee's company phone (iPhone 15 Pro, Serial #ABC123)

stolen from hotel room. Police report filed. Phone contained

proprietary company data (CRM access, internal docs).

Evidence:

[Upload Police Report] → police_report.pdf uploaded

[Upload This Email Thread] → device_recovery_email.pdf uploaded

[Save Incident]

Step 4: Confirmation

Platform shows:

✅ Incident created for John Doe

Incident ID: INC-2026-03-13-001

Created by: Jane Smith (HR) on behalf of John Doe

John will be notified via email.

[View Incident] [Create Another Incident]

Employee Notification

John receives email:

Subject: Incident Documented: Phone Stolen in London

Hi John,

Jane Smith (HR Manager) documented an incident on your behalf:

Incident: Phone stolen in London

Date: March 10, 2026

Location: Hotel Intercontinental, London

Evidence uploaded:

- Police report

- Email thread (device recovery)

You can view and edit this incident anytime.

[View Incident in Platform]

This was documented to help you if you need to file an

insurance claim or report to IT security.

Event Ledger Integration

Required Ledger Events:

Event Type	Trigger	Fields
incident_created_on_behalf	Corporate admin creates incident for employee	incident_id, subject_id (employee), actor_id (admin), actor_role
evidence_uploaded_on_behalf	Corporate admin uploads evidence for employee	evidence_id, subject_id, actor_id, filename
incident_note_added_on_behalf	Corporate admin adds note to employee incident	incident_id, subject_id, actor_id, note_text

All events immutable and append-only.

Privacy & Security

Employee Privacy Protected:

- Corporate admin CANNOT see employee's personal evidence (vacation photos, personal receipts)
- Corporate admin CAN ONLY create NEW incidents (cannot modify existing employee-created incidents without permission)
- Employee can revoke corporate admin's access to specific incidents (privacy control)

Audit Trail:

- All "on behalf" actions logged with actor_id (who did it) and subject_id (who it's for)
- Founder receives monthly summary: "Jane Smith created 5 incidents on behalf of employees"

Use Case Example: Device Theft

Scenario: John's company phone stolen in London

Traditional Process (without platform):

1. John calls HR: "My phone was stolen"
2. HR: "File police report, email us a copy, fill out IT security form, contact insurance"
3. John: Scrambles to do all this while traveling, documents scattered across emails
4. 2 weeks later: "Where's that police report? I can't find the email"

With Platform (Corporate Admin On Behalf):

1. John calls HR: "My phone was stolen"
2. HR (Jane): "I'll document this for you right now"
3. Jane logs into platform, creates incident, uploads police report
4. John receives email: "All documented. View incident here: [link]"
5. **Everything in one place**: Police report, IT security notification, insurance claim documentation
6. 2 weeks later: John files insurance claim → Opens platform → Downloads complete incident packet

Result: Less friction, better documentation, faster claims processing

---

Integration Points

- **Section 2.5** (Corporate Account Model): Corporate admin dashboard permissions
- **F-6.5.6** (Evidence Management): Corporate admin evidence upload flow
- **Section 8.4** (Audit Logs): Event ledger emission for "on behalf" actions

---

Section 2.5.8 — Corporate Admin Acting on Behalf of Employee | v1.0 | March 2026

SECTION 2.5.9 — Corporate DPV Bypass Protocol

Parent Section: Section 2.5 (Corporate Account Model)
Status: v1.0 — Approved March 2026

Purpose

Establishes formal protocol for corporate administrators requesting Dual-Presence Verification (DPV) bypasses for employees who have lost access to all devices.

Integration: Works with F-6.6.3 (Dual-Presence Verification) and Section 2.5.9 (Corporate Admin Acting on Behalf)

When DPV Bypass Is Needed

Scenario: Employee cannot perform high-risk action because they lost access to all trusted devices

High-Risk Actions Requiring DPV:

- Change primary email address
- Reset password (when 2FA unavailable)
- Add new trusted device
- Delete account
- Change billing information

Without bypass: Employee permanently locked out (cannot add new device without DPV)

Bypass Request Requirements

ALWAYS REQUIRED:

1. **Reason** (dropdown):
    - Lost all devices
    - Device(s) stolen
    - Device(s) broken/damaged
    - Account locked (forgot password + no 2FA)
2. **Detailed explanation** (multi-line text, AI summarized):
    - What happened
    - When it happened
    - Where it happened
    - Current status

3. **Specific action** (dropdown):
    - Change email FROM [old@email.com] TO [new@email.com]
    - Reset password
    - Add new trusted device
4. **In-person verification** (at least one):
    - ✅ Employee ID badge (#XXXXX)
    - ✅ Video call (confirmed face matches photo)
    - ✅ Manager confirmation (Name + Title)
5. **Acknowledgment**:
    - ✅ "I understand this will be logged and audited"

ENCOURAGED (Optional):

6. **Evidence**:
    - Police report (if theft/loss)
    - Insurance claim (if damage)
    - No evidence explanation (if not applicable)

AI Email Summarization

When HR manager submits request, AI processes raw input and generates summary

Example:

Raw Input:

johns phone got stolen in london last week at the hotel.

he cant login anywhere now because his laptop is still at

the office back in new york and he needs to change his

email asap to the new one we set up for him

AI Summary (sent to Founder):

SITUATION: Employee's phone stolen in London (hotel).

Laptop inaccessible at NY office. Employee cannot access

account from any device.

ACTION NEEDED: Change primary email

From: john.doe@oldprovider.com

To: john.doe@acmecorp.com (corporate-provisioned)

VERIFICATION:

✅ Employee ID badge verified (#A12345)

✅ Manager confirmation (Jane Smith, CTO)

RISK: Low (routine email change, full verification)

MISSING: Police report date, exact theft date

Founder receives BOTH:

- AI summary (quick read)
- Original message (if clarification needed)

Founder Email Format

Subject: [PRIORITY - CORPORATE] DPV Bypass Request: Acme Corp

HIGH PRIORITY - Corporate Account Request

Account: Acme Corp (50 employees, $10K/year contract)

Requested by: Jane Smith (HR Manager, jane.smith@acmecorp.com)

Employee: John Doe (john.doe@email.com)

AI SUMMARY

[AI summary as shown above]

[APPROVE] [DENY] [REQUEST MORE INFO]

ORIGINAL MESSAGE FROM HR MANAGER:

[Raw message from HR manager]

Audit Trail:

- Request submitted: March 13, 2026 4:15pm EST

- Corporate admin: jane.smith@acmecorp.com

- Employee: john.doe@email.com

[View Full Request in FOCL]

Approval Process

Step 1: Founder Reviews Request (~30 seconds)

Green Flags (approve immediately):

- ✅ Full in-person verification
- ✅ Specific action described
- ✅ Legitimate reason with police report
- ✅ Corporate account in good standing

Red Flags (deny or request more info):

- ❌ Vague reason
- ❌ No in-person verification
- ❌ High-risk action (billing change, account deletion)
- ❌ Corporate account has suspicious history

Step 2: Founder Clicks [APPROVE]

Platform generates **6-digit bypass code**: A7B9C2

Step 3: Founder Receives Code

✅ DPV Bypass Approved: Acme Corp - John Doe

Bypass Code: A7B9C2

Give this code to the HR manager (Jane Smith).

The employee will enter this code when adding their new device.

Code expires: 24 hours or after 1 use

Step 4: Founder Replies to HR Manager

Subject: ✅ DPV Bypass Approved: John Doe

Hi Jane,

I've approved the DPV bypass for John Doe.

Bypass Code: A7B9C2

NEXT STEPS:

1. Give this code to John in-person (verify his identity first)

2. John should log in on his new device and enter the code

3. Code expires in 24 hours or after 1 use

Document this incident in the platform

Here's how:

1. Log into the platform

2. Go to Corporate Dashboard → Employee Profile

3. Create incident for the employee

4. Upload relevant evidence (police reports, documentation, etc.)

Need help documenting this? Reply to this email.

Best,

Christian

Founder, Wayfarer

Audit: Bypass approved March 13, 2026 4:30pm EST

Request ID: #2026-03-13-ACME-001

Pre-Authorization (Trusted Corporate Admins)

For high-paying clients ($10K+/year), Founder can grant pre-authorization

FOCL Configuration:

Corporate Account: Acme Corp

DPV Bypass Pre-Authorization:

☐ Allow HR Manager (Jane Smith) to approve DPV bypasses without Founder review

Limits (if enabled):

• Maximum bypasses per month: [5]

• Allowed actions:

[✓] Email address changes

[✓] Password resets

[ ] Billing changes (always requires Founder)

[ ] Account deletions (always requires Founder)

Audit:

• All bypasses logged to event ledger

• Monthly summary emailed to Founder

• Founder can revoke authority anytime

[Save Settings]

Monthly Audit Email:

Subject: [MONTHLY AUDIT] Corporate DPV Bypasses - March 2026

Acme Corp (Jane Smith, HR Manager):

- 3 bypasses approved (within 5/month limit)

- March 5: Email change for John Doe
- March 12: Password reset for Sarah Lee
- March 20: Email change for Mike Chen

✅ No issues detected

[View Full Audit in FOCL] [Revoke Pre-Authorization]

Abuse Detection:

Subject: [ALERT] Corporate DPV Bypass Limit Exceeded

Acme Corp (Jane Smith, HR Manager):

- 6 bypasses approved (EXCEEDED 5/month limit)
- High-risk bypass approved: Billing change (should require Founder)

Action required: Review and revoke pre-authorization if necessary

[View Details] [Revoke Pre-Authorization]

Event Ledger Integration

Event Type	Trigger	Fields
dvp_bypass_requested	Corporate admin submits request	request_id, corporate_account_id, employee_id, reason
dvp_bypass_approved	Founder approves	request_id, approved_by (Founder), bypass_code

dvp_bypass_denied	Founder denies	request_id, denial_reason
dvp_bypass_code_generated	Platform creates code	code, account_id, expires_at
dvp_bypass_code_used	Employee uses code	code, used_by, used_at, device_id
dvp_bypass_pre_auth_granted	Founder grants pre-authorization	corporate_account_id, admin_id, limits
dvp_bypass_pre_auth_revoked	Founder revokes pre-authorization	corporate_account_id, revoked_by, reason

---

Data Model

DvpBypassRequest Table:

```
CREATE TABLE dvp_bypass_requests (
  request_id UUID PRIMARY KEY,
  corporate_account_id UUID REFERENCES corporate_accounts(account_id),
  requested_by UUID REFERENCES accounts(account_id), -- HR manager
  employee_id UUID REFERENCES accounts(account_id),
  reason VARCHAR(100),
  detailed_explanation TEXT,
  specific_action VARCHAR(200),
  verification_method VARCHAR(100),
  evidence_attached BOOLEAN,
  status VARCHAR(20) CHECK (status IN ('pending', 'approved', 'denied')),
